

Test Plan: BUG: Highlighting right/wrong tiles

1. What's Being Tested

One sentence: what was broken, and under what condition did it happen?

Recently functionality was added to highlight wrong tiles for a second guess at a correct response. However, the process was not well tested by the human. On the second failed attempt, the screen shows as follows.

2. Why It Matters / Risk

One or two sentences: what does the user actually experience if this is wrong? Why is this worth testing specifically, versus something else in the app?

The main action button says "check" but tiles are still in the selected pool.

- The tile pool is not reset, which means it is not ready for the next attempt.
- It is not clear on how to proceed with the exercise.
- The user is likely confused on what to do next.

3. What Else Might Be Affected

List any other app areas, features, or functions that share code, data, or state with this bug/feature — the places a fix or change here could cause a ripple effect elsewhere, even if you don't expect it to.

This should only affect the exercise screen and not the main scenario picking screen.

4. Test Cases and Pass-Fail

List 3–5 cases. Include at least one happy-path case and at least one edge case. For a bug, include the exact original failing case plus 1–2 nearby variations. For a feature, pick cases deliberately: one normal input, one invalid/unexpected input, one boundary condition.

#	Input / Action	Expected Result	Pass / Fail
TC-10	first attempt just failed, three failed attempts required to see "show answer" button	see disabled button say "Check", tiles reset to initial state	Pass
TC-20	second attempt just failed, three failed attempts required to see "show answer" button	see button say "Try again", and right/wrong tiles highlighted	Pass
TC-30	second attempt just failed, three failed attempts required to see "show answer" button, and the exercise has "alt" answers	see button say "Try again", and right/wrong tiles highlighted, but only for the main answer, not the "alt" answer	Pass
TC-40	second attempt failed, user tries to click any tiles	nothing happens	Pass
TC-50	second attempt failed, user clicks "try again"	tiles reset to initial state for third attempt	Pass

TC -60	third attempt just failed, again three failed attempts required to see "show answer" button	see two buttons that say "show answer" and "try again" and right/wrong tiles highlighted	Pass
TC -70	third attempt failed, user clicks "try again"	tiles reset to initial state for fourth attempt	Pass
TC -80	third attempt failed, user clicks "show answer"	answer shown, action button says "next sentence"	Pass
TC -90	any number of failed attempts after third attempt, which shows "show answer" button	same behavior as third attempt	Pass

5. Takeaway

One or two sentences: what did this confirm? If you had more time, what would you test next?

This covers actions taken upon a wrong response and highlighting wrong tiles.
